Executive Summary

This report presents results of contamination assessment activities conducted on the Highway Trailer building property located at 501 E. South Street, Stoughton. The property has been historically occupied by a multi-story manufacturing and truck assembling facility that has more recently been used for warehousing truck parts and manufacturing equipment. Phase 1 environmental site assessment activities were conducted on the property in July 2009 in conjunction with a possible property transaction and site redevelopment. Results of the Phase 1 ESA indicated several recognized environmental conditions including a reported diesel underground storage tank on the southwest portion of the property, a spray painting area inside the building, a former coal storage area, former railroad spur, and a possible PCB containing electrical substation. A former foundry was also reported on the property south of the Highway Trailer building.

Subsurface contamination assessment activities were subsequently conducted in the areas identified in the Phase 1 ESA. Eleven soil probes were advanced and three monitoring wells installed in areas of concern on the property. Each probe was advanced to 10 feet below land surface (bls). Monitoring wells were installed to 15 feet bls. Soil and groundwater samples collected during assessment activities were analyzed for volatile organic compounds (VOC), polycyclic aromatic hydrocarbons (PAH), and heavy metals.

Subsurface material encountered during assessment activities was comprised of between 1 and 5 feet of mixed clay and sand fill with pockets of cinders. Native soil beneath the fill consisted of layers of clay and sand. Water level measurements taken during groundwater sampling activities indicate that the water table is between 7 and 10 feet bls.

Chemical analysis of soil samples detected contaminant concentrations in samples of fill material. Concentrations of PAH, arsenic, and lead were detected above non-industrial and industrial standards. The highest contaminant concentrations generally correlated with fill material containing cinders. Analysis of groundwater samples detected low levels of contamination at concentrations below enforcement standards.

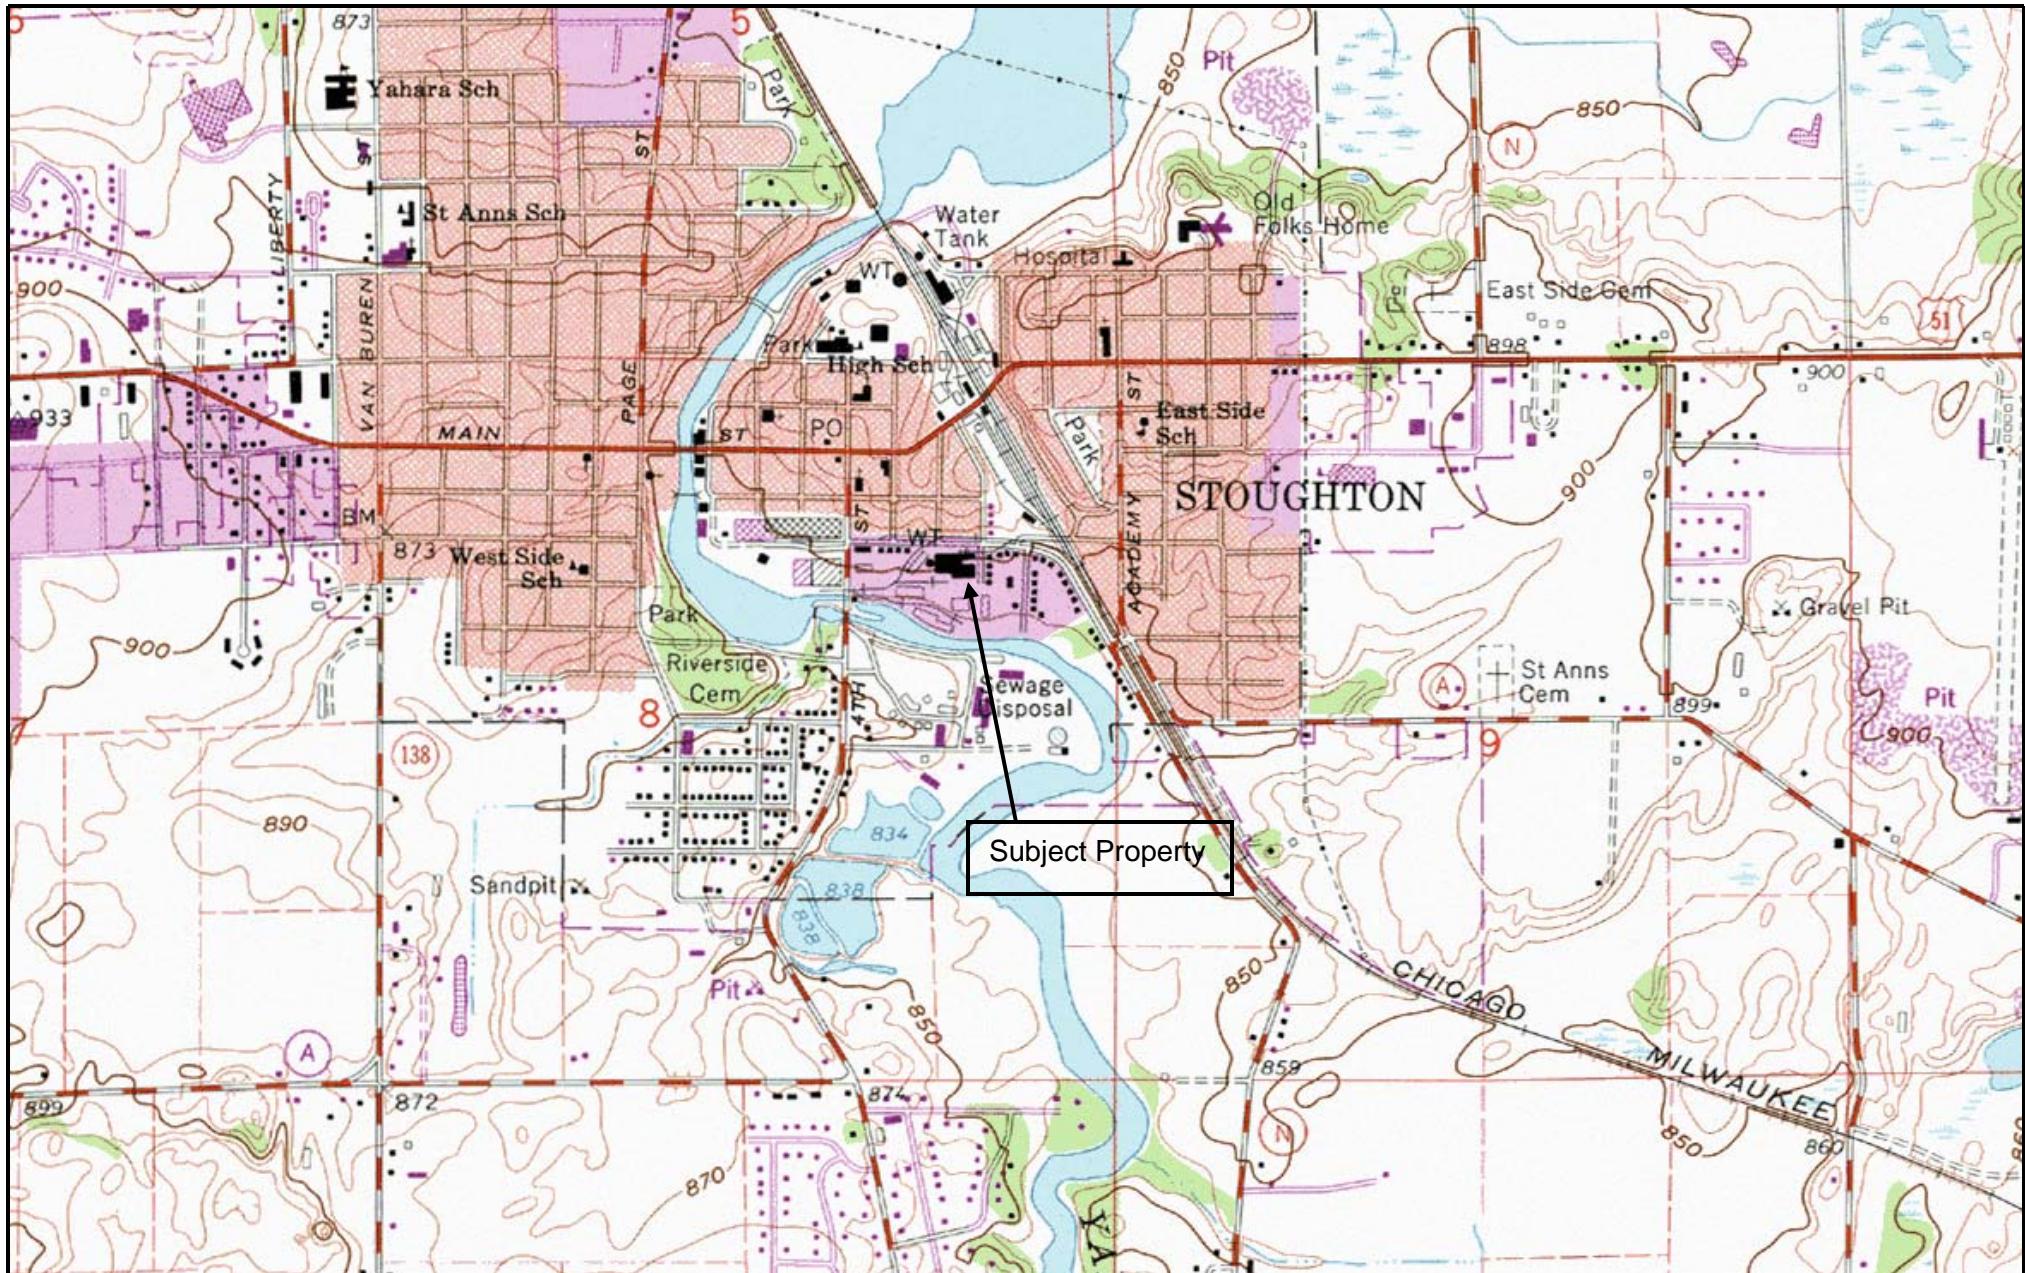

Chemical analysis and observations made during this assessment indicate fill material beneath the site, in particular fill containing cinders, is impacted with contamination at concentrations considered a risk to human health from direct contact. Because the building that occupies the property encompasses the majority of the site, most of the contamination is directly beneath the building. The low levels of contamination detected in groundwater indicate that contamination in the fill is not readily leaching through the soil column to the water table. This is in part a result of the building and paved surfaces on the property providing an impermeable barrier for percolation of precipitation through the soil.

If the building and pavement were removed during site redevelopment, removal of hot spot PAH and metals impacted soils is recommended to minimize the risk to direct contact to the general public and on-site workers during the redevelopment process. As part of the final redevelopment, a low permeability cap, that could include buildings and paved surfaces, is recommended to prevent future direct contact risks as well as mitigate migration of contaminants to the groundwater.

Introduction

The City of Stoughton and its Redevelopment Authority authorized Ayres Associates to perform subsurface contamination assessment activities on the Highway Trailer Building property (Figure 1). The property is an approximate 2 acres of relatively level land situated in an area of mixed residential and industrial properties approximately 300 feet north of the Yahara River. The property is occupied by a single 43,000 square foot four-story building that has been used for wagon and truck manufacturing since the later 1800's. The manufacturing process included wood working, metal working, welding, machining, spray painting, and assembly. Coal fired boilers and coal storage area formerly occupied the northeast portion of the property. An electrical substation is situated outside the southeast corner of the building. A former diesel underground storage tank was reportedly located in the southwest portion of the property. Remnants of a former railroad siding are present along the southern property boundary. A foundry was formerly located on property south of the site.

The City of Stoughton Redevelopment Authority (RDA) is considering purchase of the property for possible future redevelopment. Prior to purchase, the Stoughton RDA requested a Phase 1 ESA and subsurface contamination assessment activities be conducted to evaluate possible environmental liabilities. This report documents subsurface contamination assessment activities conducted on the site in July 2009.

Contamination Assessment Activities

A total of 11 soil probes (P-1 through P-11) and 3 water table monitoring wells (MW-1 through MW-3) were installed on the property on July 14, 2009, to assess subsurface contamination associated with historical use of the property as a truck manufacturing and assembly facility. Soil probes were advanced to 10 feet below land surface (bls). Monitoring wells were installed to 15 feet (bls). Because the building occupies a large portion of the property, most of the soil probes were advanced within the building. Probes were advanced in areas of concern and inside accessible portions of the building. Soil probe and monitoring well locations are shown on Figure 2.

Soil was continuously sampled from each probe and well borehole and characterized according to the Unified Soil Classification System (USCS). Volatile organic vapors were screened in each sample using an HNu equipped with an 11.7 eV lamp. Methods and procedures used during soil probing and monitoring well installation activities are contained in Appendix A. Boring logs are included in Appendix B.

One soil sample collected from each soil probe and monitoring well location were submitted for laboratory analysis of volatile organic compounds (VOC), polycyclic aromatic hydrocarbons (PAH), arsenic, cadmium, chromium, and lead depending upon sampling location. Soil sampled adjacent to the electrical substation was also analyzed for PCB. Groundwater samples were analyzed for VOC, PAH, and RCRA metals. However, because of an insufficient volume of groundwater in monitoring well MW-2, due to slow recharge in the low permeability subsoil, analysis of PAH could not be conducted. A summary of laboratory analysis conducted on soil and groundwater samples is contained in Appendix A.

Material encountered across the site was comprised of between 1 and 5 feet of mixed sand and clay fill underlain by clay with pockets of cinders. Native material beneath the fill consisted of layers of clay and sand. Water level measurements taken during groundwater sampling activities indicate that groundwater is between 7 and 10 feet bls. Incidental odors, soil discoloration, and volatile organic vapor concentrations above background levels were not noted during soil sampling activities.

Analytical Results

Laboratory analysis detected low level concentrations of volatile organic compounds (VOC) in several soil samples. Concentrations of PAH were detected above non-industrial direct contact residual contaminant levels (RCL) in soil sampled from P-1, P-2, P-9, P-10, P-11, and MW-3. Benzo(a)pyrene was detected at concentrations greater than industrial direct contact RCL in soil sampled from P-1 and P-10. Arsenic was detected at concentrations greater than industrial RCL in soil sampled from P-5, P-6, P-8, P-10, MW-2, and MW-3. The non-industrial RCL was exceeded in soil sampled from P-11 and MW-1. Lead concentrations above the non-industrial RCL were detected in soil samples collected from P-1, P-4, and P-11. Soil sampled from P-3 and MW-3 contained lead concentrations above the industrial RCL. Laboratory analysis of PCB conducted on soil sampled from MW-2 installed adjacent to the electrical substation did not detect PCB concentrations greater than laboratory method detection limits.

Groundwater analysis did not detect VOC, PAH, nor RCRA metal concentrations greater than enforcement standards. Soil sample analytical results are summarized in Tables 1 through 3. Groundwater sample analytical results are summarized in Tables 4 through 6. Laboratory reports are contained in Appendix C.

Conclusion and Recommendations

Environmental assessment activities were conducted on the former Highway Trailer building property located at 501 E. South Street, Stoughton, to assess possible subsurface contamination associated with over 100 years of manufacturing, assembling and warehousing truck parts and equipment. In addition to activities conducted on the property, a foundry had operated on adjacent property for several decades. Subsurface environmental activities were conducted on the property in several areas identified in the Phase 1 environmental site assessment (ESA) as being a possible environmental liability.

Subsurface assessment activities were conducted in accessible areas within the building identified in the Phase 1 as being potential areas of environmental liability. These areas included the spray painting room, body assembly room, and former boiler room. Assessment activities were also conducted outside the building in the area of a reported diesel tank, along the former railroad spur, adjacent to the electrical substation and coal storage area.

Between 1 and 5 feet of fill material was encountered during soil sampling activities. Several areas of fill contained cinders, brick, and concrete. Samples of fill material within 4 feet of the ground surface were collected and submitted for laboratory analysis to evaluate the risk to human health from direct contact. Groundwater samples were also collected from three monitoring wells installed on the site to assess possible impacts to underlying groundwater.

Results of assessment activities conducted in July 2009 indicate that near surface material contains contaminant concentrations considered a risk to human health from direct contact. The contaminants of concern are PAH compounds, arsenic, and lead. The highest levels of lead, detected at concentrations greater than industrial RCL, were generally detected in areas where cinders were encountered. Contaminant concentrations were detected above non-industrial standards in every sampling location except for P-2, P-7, and MW-1. Because the former manufacturing facility occupies a large portion of the site, the majority of the contamination detected is beneath the building. Impacts to groundwater at concentrations above enforcement standards were not detected in the three wells installed during this assessment.

Based upon results of this assessment, environmental activities are warranted to remediate near surface soil containing PAH and heavy metal concentrations greater than RCL. Proposed future redevelopment of the property will expose on site workers and the general public to near surface contamination. It is recommended that hot spot near surface soils be removed and properly disposed. Any remaining residual soil contamination should be capped. This cap can be incorporated into the redevelopment of the site and could include buildings, pavement, or a low permeability cover to inhibit infiltration of precipitation and migration of contaminants to the groundwater. Because groundwater does not contain contaminant concentrations greater than enforcement standards, additional environmental activities associated with the groundwater are not warranted.

Appendix A

Methods and Procedures

Sample Handling, Screening, and Analysis

Soil Screening

Soil samples were screened using an HNU photo ionization detector (PID). The HNU was equipped with an 11.7 eV lamp and calibrated for direct reading in vapor parts per million (vppm) of total organic vapors using an isobutylene standard. The HNU was calibrated daily and periodic calibration checks were made with an isobutylene standard.

The field instrument was "zeroed" in the field at the location of screening prior to commencement of screening activities. Ambient air (background) readings were made and recorded at various intervals during field activities. Potential sources of ambient organic vapor levels were noted, along with their context to the screening location. Additional information regarding atmospheric conditions (approximate air temperature, approximate wind speed, and direction) was also recorded. Efforts were made to locate the field screening upwind from the excavation. Sample containers used for field screening purposes consisted of 1-gallon Ziploc™ polyethylene freezer bags. Sample containers were pre-screened to insure that no organic vapors existed within the freezer bags prior to sample collection.

Field screening was accomplished by recording the highest and/or most stable reading obtained after allowing the manufacturer's specified minimum reading time to elapse. The instrument was allowed to evacuate all sample-derived organic vapors as evidenced by comparing the meter reading with the noted ambient air reading collected prior to sample screening. Any changes in the background reading during the screening process were noted.

Logs were kept regarding relative horizontal and vertical location of each sampling point, screening location, background organic vapor level, organic vapor screening levels, approximate screening duration, and obvious identifiable zones of contamination. In addition, pertinent information regarding PID calibration and operation was recorded.

Soil Sample Collection for Analytical Purposes

Soil samples collected for analytical purposes were chosen on the basis of visual and olfactory observations and in-field conditions at the time of sample collection.

Samples intended for laboratory analysis were immediately placed in sample containers provided by the analytical laboratory. Containers were sealed upon collection. Each sample was then labeled with a sample number, location, date, the initials of the sampler, and the parameters to be analyzed. The samples were then placed in a clean cooler with ice. The samples were maintained on ice throughout shipment to the laboratory.

Chain of Custody

Upon collection of soil and/or groundwater samples intended for laboratory analysis, a chain-of-custody record was initiated. The chain-of-custody included the following information: project, job number, shipped by, shipped to, shipping method, sampling point, location, ID number, date collected, sample type, number and type of containers, analysis required, sampler(s), signature(s), etc. As few people as possible handled the samples.

Soil and Groundwater Sampling

Laboratory Analysis

One soil sample collected from each soil probe and monitoring well location, a total of 14 soil samples were submitted to a state certified laboratory for analysis. One groundwater sample was also collected from each of the three monitoring wells installed on the site. Soil and groundwater samples collected for laboratory submittal were analyzed for compounds anticipated to be encountered in each area. The following table outlines the sampling scheme.

1. Reported Diesel Tank Area

<u>Sampling Detail</u>	<u>Probe</u>	<u>Analysis</u>
Probe/well	MW-1	
Soil samples	1	VOC, PAH, arsenic, cadmium, chromium, lead
Groundwater samples	1	VOC, PAH, RCRA Metals

2. Adjacent to Former Railroad Spur

<u>Sampling Detail</u>	<u>Probe</u>	<u>Analysis</u>
Probe/well	P-1	
Soil samples	1	VOC, PAH, arsenic, cadmium, chromium, lead

3. Former Spray Painting Area

<u>Sampling Detail</u>	<u>Probe</u>	<u>Analysis</u>
Probe/well	P-2, P-4	
Soil samples	2	VOC, arsenic, cadmium, chromium, lead
Probe/well	P-3	VOC, PAH, arsenic, cadmium, chromium, lead
Soil samples	1	VOC, PAH, arsenic, cadmium, chromium, lead

4. Electrical Substation

<u>Sampling Detail</u>	<u>Probe</u>	<u>Analysis</u>
Probe/well	MW-2	
Soil samples	1	Arsenic, cadmium, chromium, lead, PCB
Groundwater samples	1	VOC, RCRA metals

5. Body Assembly Area

<u>Sampling Detail</u>	<u>Probe</u>	<u>Analysis</u>
Probe/well	P-5, P-6, P-7, P-8	
Soil samples	4	VOC, PAH, arsenic, cadmium, chromium, lead

6. Former Boiler Room

<u>Sampling Detail</u>	<u>Probe</u>	<u>Analysis</u>
Probe/well	P-9	
Soil samples	1	VOC, PAH
Probe/Well	P-10	
Soil Samples	1	VOC, PAH, arsenic, cadmium, chromium, lead

7. Former Coal Storage

<u>Sampling Detail</u>	<u>Probe</u>	<u>Analysis</u>
Probe/Well	P-11, MW-3	
Soil samples	2	PAH, arsenic, cadmium, chromium, lead
Groundwater samples	1	VOC, PAH, RCRA metals

PAH: polycyclic aromatic hydrocarbons

VOC: volatile organic compounds

Notes regarding entire Chain of Custody:

Notes:

* Indicates Value in between LOD and LOQ.

^ Indicates the laboratory is NELAP accredited for this analyte by the indicated matrix and method.

All samples were received intact and properly preserved unless otherwise noted. The results reported relate only to the samples tested. This report shall not be reproduced, except in full, without written approval of this laboratory. The Chain of Custody is attached.

This report has been specifically prepared to satisfy project or program requirements. Although certain analyses may indicate NELAP accreditation, the parameters may not necessarily have been analyzed and/or reported following NELAP conventions or requirements.

QC Qualifiers

Code	Description
A	Analyte averaged calibration criteria within acceptable limits.
B	Analyte detected in associated Method Blank.
C	Toxicity present in BOD sample.
D	Diluted Out.
E	Safe, No Total Coliform detected.
F	Unsafe, Total Coliform detected, no E. Coli detected.
G	Unsafe, Total Coliform detected and E. Coli detected.
H	Holding time exceeded.
J	Estimated value.
L	Significant peaks were detected outside the chromatographic window.
M	Matrix spike and/or Matrix Spike Duplicate recovery outside acceptance limits.
N	Insufficient BOD oxygen depletion.
O	Complete BOD oxygen depletion.
P	Concentration of analyte differs more than 40% between primary and confirmation analysis.
Q	Laboratory Control Sample outside acceptance limits.
R	See Narrative at end of report.
S	Surrogate standard recovery outside acceptance limits due to apparent matrix effects.
T	Sample received with improper preservation or temperature.
V	Raised Quantitation or Reporting Limit due to limited sample amount or dilution for matrix background interference.
W	Sample amount received was below program minimum.
X	Analyte exceeded calibration range.
Y	Replicate/Duplicate precision outside acceptance limits.
Z	Calibration criteria exceeded.

Notes regarding entire Chain of Custody:

Notes:

* Indicates Value in between LOD and LOQ.

^ Indicates the laboratory is NELAP accredited for this analyte by the indicated matrix and method.

All samples were received intact and properly preserved unless otherwise noted. The results reported relate only to the samples tested. This report shall not be reproduced, except in full, without written approval of this laboratory. The Chain of Custody is attached.

This report has been specifically prepared to satisfy project or program requirements. Although certain analyses may indicate NELAP accreditation, the parameters may not necessarily have been analyzed and/or reported following NELAP conventions or requirements.

Notes regarding entire Chain of Custody:

Notes:

* Indicates Value in between LOD and LOQ.

^ Indicates the laboratory is NELAP accredited for this analyte by the indicated matrix and method.

All samples were received intact and properly preserved unless otherwise noted. The results reported relate only to the samples tested. This report shall not be reproduced, except in full, without written approval of this laboratory. The Chain of Custody is attached.

This report has been specifically prepared to satisfy project or program requirements. Although certain analyses may indicate NELAP accreditation, the parameters may not necessarily have been analyzed and/or reported following NELAP conventions or requirements.
